

Go green – It does not matter how slowly you go so long as you do not stop

For millions of years, the earth has been such a beautiful place when it used to be full of greeneries and many different and unique animals living on earth. For the past few years, this beautiful place is encountering a lot of problems and greenhouse effect is one of it. Who could be blamed for this to happen to the earth? The most suitable answer is the most unique creation created on earth which is mankind. How are humans responsible for this act? People have been polluting earth, destroying Mother Nature and killing many animals resulting imbalanced ecosystem. How can this issue be solved? Go green is the best way to save our planet. We can go green by encouraging people to plant more trees, reduce open burning and increase the usage of recyclable products.

Mankind should take up the responsibility to plant more trees. Statistics have shown that nearly thousands of trees are being chopped down to be made into daily products such as papers, souvenirs and furnitures. In order to replace those trees, people should plant more trees. When mankind starts to plant these trees, temperature could be reduced. We need to remember that we still have icebergs at the North Pole and if temperature hikes up, the ice will melt and it may result in we being washed away from the surface of the earth when the water level increases due to the melting of ice. Thus, by planting more trees, we are reducing the temperature and also saving our lives from getting washed away.

Next, people around the earth seriously need to stop open burning. This is because when open burning takes place, we tend to produce more poisonous gas. Again this point relates to the first point which is hiking up the temperature of earth. This irresponsible act has already given a bad impact to earth which is having holes on the ozone layer of the earth. This way we will be getting direct heat from the sun which makes our planet even hotter than it used to be. In conclusion, mankind needs to stop open burning in order to prevent from making the holes even bigger.

Besides that, people should increase the usage of recyclable products rather than using non-recyclable products. What are the examples of recyclable products? Using recycled paper instead of buying normal paper, using recycled pencils instead of normal pencils and using recyclable paper bags instead of plastic bags. This will at least reduce the usage of plastic products. Yes, plastic products can also be recycled but it has a number of range for the times

it can be recycled. Hence, it is still going to pollute earth. In conclusion, mankind needs to use products that can be recycled.

As a conclusion, it only takes small steps to save the earth but it takes a big heart to do so. The steps may seem very small but it can save our planet which is huge. We need to understand in order to care, we need to help save the planet earth.
